

EconomicBridge

AI & Satellite Intelligence for Agriculture, Food Security & Aid

Operated by Bizra Farms Integrated Nigeria Limited

Live platform · bizrafarms@gmail.com · +234 703 791 9465

Seaside Startup Summit Armenia 2026

The Problem

Hundreds of millions depend on smallholder farming. Much of the loss is preventable.

- Across West Africa, smallholder farmers lose crops, land and livelihoods to floods, drought, crop disease and conflict, season after season.
- Governments and aid agencies respond almost blind: data is national, months out of date, and disconnected from what is happening on the ground.
- Every disaster leaves a signal in the soil, water and heat long before it strikes, but no one is reading those signals in time.
- The result: preventable losses, misdirected aid, and lives at risk.

The Solution

A satellite-and-AI early-warning system for the people who feed the continent.

- EconomicBridge turns live earth-observation data into early warning and decision support, at local-government-level granularity.
- One platform gives governments, NGOs and regional bodies a real-time picture: forecast, reality on the ground, and who is affected.
- Detect crop disease, flood and drought, and predict conflict 24 to 72 hours ahead, then deliver the alert to the people who need it.

One platform, seven intelligence modules

- CropGuard: AI crop-disease diagnosis from a leaf photo + satellite vegetation health
- ShockGuard: flood and drought detection from all-weather satellite radar
- Farmland Protection: conflict and encroachment early warning (24-72h)
- Economic Visibility: poverty and settlement mapping from satellite data
- Mobility Compass: income and cost-of-living intelligence
- SkillsBridge: education access and connectivity mapping
- Aid Coordination: agency coverage and gap mapping

Built on live, authoritative data

- Copernicus Sentinel-1 (radar) and Sentinel-2 (vegetation/NDVI)
- NASA FIRMS active-fire detections and VIIRS night-lights
- World Bank economics, UNICEF GIGA schools, WorldPop population grids
- AI: a ResNet-50 crop classifier (87% validation), conflict prediction, and SAR / NDVI anomaly detection
- Honest provenance: live observations are always labelled distinctly from modelled baselines, so decision-makers trust what they see.

Live in production not a prototype

700+

Local government areas / districts covered across Nigeria, Ghana and Senegal

7

Live satellite and economic data feeds, self-scheduled daily/weekly

87.2%

Validation accuracy of our trained ResNet-50 crop-disease model

5

Microservices on AWS with CI/CD and multi-tenant data isolation

Designed to scale to 52 administrative units: 36 Nigerian states + FCT + 15 ECOWAS countries.

Reaching the last mile

Technology only matters if it reaches the person in the field.

- Farmers need no smartphone, no app and no literacy: alerts arrive as a simple SMS.
- Multilingual by design: English, French and Portuguese live; Hausa, Yoruba and Igbo in preparation.
- Delivered through trusted partner agencies, registration-free and privacy-first.
- 24 to 72 hours of early warning means time to act: protect a harvest, move livestock, evacuate, or pre-position aid.

Market

- Immediate market: 36 Nigerian states + FCT, plus 15 ECOWAS member states (52 administrative tenants).
- Buyers: state governments, federal agencies (disaster, agriculture), NGOs, and regional bodies such as ECOWAS.
- Tailwind: climate-adaptation and food-security funding is scaling fast across Africa.
- Expansion path: the same platform template extends across Sub-Saharan Africa, one tenant at a time.

Business Model

- SaaS subscription per government / agency tenant: a free pilot converts to an annual licence.
- Tiered by modules and by coverage (per-state, federal, and regional licensing).
- Premium automated reports and data exports.
- Farmer SMS stays free at the point of use, funded by institutional subscriptions and donor programmes: impact and revenue aligned.

Traction & Momentum

Built first, selling now: the product is done, the conversations are open.

- Platform live on AWS with multi-tenant onboarding ready today.
- Active outreach underway to state governments, NEMA and the ECOWAS Commission (formal proposals delivered).
- Inbound interest from a serving State Commissioner; first beta onboarding in progress.
- Submitted to the Zayed Sustainability Prize and the WFP Innovation Challenge.

Team

A lean, execution-first team that turned an idea into a live platform.

- Abdullahi Zuru Ibrahim, Founder & CEO: product vision, partnerships, and an AI-native build that shipped a full production platform lean.
- Operated by Bizra Farms Integrated Nigeria Limited.
- Seeking: technical, agronomy and go-to-market partners to scale across West Africa.

The Ask

Vision: every farmer visible, every harvest protected, every life seen in time.

- We are seeking investment, mentorship and partnerships, and the network this summit convenes.
- Use of funds: field pilots with partner agencies, team, and go-to-market across Nigeria and ECOWAS.
- Together we can make early warning the default, not the exception.
